

Interactive Portfolio Documentation

Akash Kajla — B.Tech Computer Science & Engineering

1. Introduction

This documentation covers the architecture, file organization, and custom integrations developed for the portfolio website of Akash Kajla.

The website functions as a premium, interactive, single-page developer showcase featuring modern glassmorphism layouts, vertical academic timelines, dynamic GitHub API data retrieval, custom repository filters, and direct resume PDF download actions.

2. Project Directory Structure

The portfolio repository consists of the following essential files located in the root directory:

- index.html: Layout grid structures, page content containers, navigation elements, and Lucide icons support.
- style.css: Modern styling rules, gradient colors, responsive breakpoints, vertical timeline lines, and cards hover slide-in keyframes.
- config.js: The data hub containing personal profile details, socials, skills categories list, and timeline milestones data.
- app.js: Logic script executing GitHub API user queries, dynamic repo rendering, repository card filtering, contact form mock, typewriter text headers loop, and scroll-reveal trackers.

3. Central Configuration (config.js)

All custom details are centralized in config.js to allow easy updates without breaking the HTML layout. Key properties include:

- githubUsername: sky-kajla (targets API fetches).
- excludeRepos: Repository names to exclude from the list (e.g. 'own-ai-model').
- repoHomepages: Defines custom demo redirects (e.g. mapping 'Portfolio' and 'sky-kajla.github.io' to the live site url).
- skills: A categorized list of tech stack skills (Languages, Databases, Concepts, Tools, Soft Skills).
- education: Array of milestones that build the vertical timeline (Degree, school, years, SGPA details).

4. Deployment Workflow & GitHub Pages

Your portfolio is hosted for free using GitHub Pages at your custom user domain:

Live URL: <https://sky-kajla.github.io>

Whenever you update your code (such as adding a new skill to config.js), push the updates using these git commands:

1. `git add .`
2. `git commit -m "Update portfolio"`
3. `git push origin main`

GitHub Actions will automatically run the build and publish the changes within a minute.
